MCP tools listed
real Composio proof

What I Built

- TypeScript pipeline: parse, discover, extract, verify, audit, publish.
- Generated case-study site from real structured JSON, not hand-edited tables.
- Docs include README architecture diagram, setup, walkthrough, methodology, and verification.

Why It Stands Out

- Composio-native proof path: SDK-style workflow plus hosted MCP session artifact.
- Gemini 3.1 Flash Lite review artifact for cost-effective second-pass reasoning.
- Composio coverage tracked: supported, partial or adjacent, and net-new opportunities.

Data Integrity

- Every row has evidence URLs and source-backed fields for auth, API surface, and blocker.
- Verifier keeps 19 issue flags visible instead of hiding uncertainty.
- Dated snapshot: API programs can change after submission, but checks passed at submission time.

Suggested form note

Please review the live case study and GitHub repo linked in this PDF. The submission includes 100 real evidence-backed app rows, 184 verified evidence URLs, Composio MCP proof, Gemini review, and reproducible commands.
